The invention also relates to mucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the against a polypeptide of the invention; an enthody polymetride of the invention, an antibody applymential a polypeptides of the invention, and methods of identifying a compound which binds to a polypeptide of the invention of a polymetric in an antibody identifying a compound which binds to a polypeptide of the invention of the invention in the invention. The invention further discloses methods of peventing, treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or
can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; diagnostic; drug screening; forensics; gene mapping; biodiversity assessment; Parkinson's disease; Alzheimer's disease; neurodegenerative diseases; anaemia; platelet disorder; wound; burns; ulcers; osteoporosis; autolimmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; gene therapy; chromosome 6q25.2-26,

ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 (ADC31861-ADC32627) and the polyneptides encoded by the invention are allocated in diagnostics, drug screening, forenasts, deme mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anaemia, platelet ancers, and in the recombinant production of a protein. The polypeptides are also used using many also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptide are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence of the invention. As sequence of the printed specification, but was obtained in electronic format directly from WIPO at

New composition for prevention and treatment of tumors and metastasis.

```
The invention discloses a composition comprising two or more isolated rate or human polymuclectides or a polymuclectide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a ckit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates to the expression of a polymuclectide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the regulates the activity of one or more of the regulates the activity of one or more of the polymuclectides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polymeptides or their antibodies. The polymuclectide or the compound that modulates its activity is useful for preparing a medicament for treating to modulates its activity is useful for preparing a medicament for treating conjury (CI) and spared nerve injury (CMUM), chronic construction injury (CI) and spared nerve injury (SNUM) in an animal (e.g. spin) endered nerve injury (SNUM) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed composition compressed the printed specification, but was obtained in electronic form directly from WIPO at Epp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 585 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or
                                                                                The invention provides a pharmaceutical composition containing ezrin protein, RNA or DNA mutated on tyrosine 353, or a functional fragment or derivative of the ezrin mutant. The new composition is useful for prevention and/or treatment of tumors, and especially metastasis. The present sequence represents the amino acid sequence of human ezrin (before the maturation by deletion of the first amino acid Met)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, diagnostic; drug screening; forensics; gene mapping; biodiversity assessment; Parkinson's disease; Alzheimer's disease; neucodegenerative disease; anaemia; platelet disorder; wound; burns; ulcers; osteoporosis; autoimmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; gene therapy; chromosome 6q25.2-26.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the

recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; a method of detecting of polymucleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or methods of invention methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the cortis sequences corresponding to the cDNs sequences of the invention (ADC31861-ADC32627) and the polymucleotide and/or polypeptides of the invention cortis sequences corresponding to the cDNs sequences of the invention (ADC31861-ADC32627) and the polypeptides encoded by the contigs (ADC32628 consected in diagnostics, drug sare enabling, forensics, gene mapping, in the cuseful in diagnostics, drug screenling, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other creating diseases such as Parkinson's disease, Alzheimer's also used for treating diseases such as Parkinson's disease, Alzheimer's cancer. The nucleic acids may also be used as hybridisation probes or chiners, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and and propered esquence of the invention. Note: The sequence cancer the patent did not form part of the printed specification, but contained in the recombinant diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  was obtained in electronic format directl

Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.

cancer.

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated at the latered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberran expression or physiological interactions of the polypeptide. Vectors comprising the consists and are also useful for producing the proteins in the early of the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins of are useful in genetic vaccination, testing and therapy, and can be used as untritional supplements. They may be used to increase stem cell proliferation, to regulate haematopoiesis, and in bone, cartilage, tendon and profession and/or are assimilation, as anti-inflammatory agents, and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human are considered proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; diagnostic; drug screening; forensics; gene mapping; biodiversity assessment; Parkinson's disease; Alzheimer's disease; hardenerive disease; anaemia; platelet disorder; wound; burns; ulcers; osteoporosis; autoimune disease; carcer; molecular weight marker; food supplement; antiparkinsonian; notropic; autoimune disease; antiensian; osteopathic; antiensemic; anticoagulant; thrombolytic; vulnerary; antitucer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; gene therapy; chromosome 6q25.2-26.

                                                                                           The invention relates to 91 nover name cure sequences (ADC291960). The invention also relates to nucleic acid sequences over 93% identical with the nover numen context invention and difficulally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; a method of detecting against a polypeptide of the invention; a method of detecting polymucleotides or polypeptides of the invention; and methods of invention further discloses methods of peventing, treating or invention further discloses methods of peventing, treating or medical condition; kits comprising polymucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the invention; methods for the polymucleotide and/or polypeptide; and 767 conting sequences corresponding to the conting sequences corresponding to the conting sequences corresponding to the conting sequences of the invention are useful in diagnostics, during screening, forensics, gene mapping, in the identification of mucations responsible for genetic disorders or other craits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's allaber's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        °,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fix. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             identífication; cytostatic; cardioactive; neuroprotective; vulnerary; immunomodulatory; muscular; gynaecological; gastrointestinal; nephrotropic; antinfective; antibacterial; gene therapy; wound; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; renal disorder; infectious disease; cardiovascular disorder;

AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, wounds, renal disorders, reproductive disorders, immune system cardiovascular disorders, reproductive disorders, and cardiovascular disorders, infectious diseases, and cardiovascular disorders, and the present invention represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; hepreceptor domain B; cytostatic; anti-HIV; antibiotic; nootropic; immune response inducer; ezrin; infectious diseases; cancer;
                                                                                                                                                                                                                                                                                            Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present sequence is domain B of human hepreceptor of human ezrin. The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AAB82021 to AAB82041) that bind to hepreceptor with greater affinity than HEP1 (see immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present sequence assembles into two anti-parallel helices with hepreceptor domain A (see AAB82019)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel human secreted polypeptides. The polypeptides are useful for polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying at therapeutic agent for use in treatment of a pathology related to aberrant expression or
                                             Novel regulatory or unfolding peptides of ezrin that binds to
Hepreceptor, useful for inducing immune response for treating infectious
diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, delivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying an expression of a polynucleotide sequence which is differentially expressed in sevence of a first animal expressed in an animal subjected to pain, a method for identifying a
physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29910.AAU3334 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, pain, neuronal tissue, gene therapy,
spinal segmental nerve injury, chronic constriction injury, CCI,
spared nerve injury, SNI, Chung.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        qq
compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypetides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CMI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymetic composition, a method for identifying a compound useful in treating companies or their antibodies. The polymucleotide or the compound that polymeptides or their antibodies. The polymucleotide or the compound that compliant (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene continguation) which is differentially expressed during pain. Note: The sequence data for this parent did not form part of the printed contingual contingu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying a compound that modulates T lymphocyte activation, useful for monitoring changes in cell surface marker expression, comprises contacting a T cell comprising an A-raf-1 or TCPTP/PTPN2 polypeptide with a compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, T lymphocyte activation; T-cell; A-raf-1; TCPTP/PTPN2; asthma; immunosuppressive, antiasthmatic; antiallergic; antiinflammatory; lymphocyte activation; lymphocyte migration; cytokine production; ell surface marker expression; antibody production; apoptosis; allergy; antibody proliferation; antibody differentiation; hypersensitivity; graft versus host disease; inflammation; moesin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human moesin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens
```

```
The invention relates to a novel method for identifying a compound that modulates T lymphocyte activation. The method comprises contacting a T cell comprising an A-raf-1 or TCPTP/PPTNZ polypeptide with a compound, where the A-raf-1 or TCPTP/PPTNZ polypeptide by a nucleic acid that hybridises to a nucleic acid encoding a polypeptide having a sequence selected from two 606-amino acid sequence and 415-amino acid sequence selected from two 606-amino acid sequence and a variant or modulation has immunosuppressive, antiasthmatic, antiallergic, and antiinflammatory activity. The method is useful for identifying compounds that modulate immunosuppressive, antiasthmatic, antiallergic, and antiinflammatory activity. The method is useful for identifying compounds that modulate Immunosuppression and differentiation, and for monitoring changes in cell surface marker expression, cytokine production, antibody production, proliferation and differentiation, and apoptosis, using either cell lines or primary cells. The A-raf-1 or TCPPP/PPNZ proteins may be used as crivation and migration, e.g. for the treatment of diseases in which modulation of the immune response is desired such as delayed type modulation of the immune response is desired such as delayed type confluence and chronic inflammation. Modulators of lymphocyte activation and acute and chronic inflammation. Modulators of lymphocyte activation and chronic inflammation. Modulators of lymphocyte activation and chronic inflammation. The present sequence is used in the exemplification of the

Diagnosing cancer cells in tissue sample, or determining prognosis or outcome of cancer patient, by calculating ratio of expression levels of genes that are differentially expressed in cancer and non cancer tissues.

Claim 77; Page 263-264; 396pp; English.

The present invention describes a method (M1) for diagnosing the presence

The present invention describes an isolated nucleic acid (I) comprising:

```
the prognosis or non-cancer cells in a tissue sample, or determining the prognosis or outcome of a cancer patient. M1 involves providing a set of genes that are differentially expressed in cancerous or non-cancerous conditions, determining the expression levels of the set of genes and calculating a ratio of the expression levels of the differentially expressed genes. M1 is useful for diagnosing the presence of cancer cells or non-cancer cells in a tissue sample, where the cancer is malignant pleural mesotheliona (MPM), lung adenocarcinoma, squamous carcinoma, medulloblastoma, prostate cancer, breast cancer, diffuse large B-cell prognosis or outcome of a cancer patient. The ratio of expression levels of differentially expressed genes is used as an indicator of cancer type, cancer class, and/or cancer prognosis, all of which are useful for determining a course of treatment of a patient. The present sequence represents a human protein which is used in an example from the present

the probabilities under stringent conditions to a hybridisation probe comprising a sequence of 1422 (human (testicular) tumour differentially expressed gene I (TDEI) encoding CDNA ADC77521).

786 (human patchy vessels (PTV) encoding CDNA ADC77521) or 1410 (human patchy vessels (PTV) encoding CDNA ADC77521) or 1410 (human patchy vessels (PTV) encoding CDNA ADC77521) or 1410 (human patchy vessels (PTV) encoding CDNA ADC77531) base pairs (bp), or the complement; or (b) a sequence that is 90% identical to the probe sequences or their complements. Also described: (1) a sequence that is at least 8 residues in length and is 90% identical to any of the composition comprising; (a) an isolated polypeptide comprising a sequence that is at least 8 residues in length and is 90% identical to any of the carrier, vascular endothelial growth factor (VBGF) and TDEI or PTV; (2) an antisense polymucleic acid comprising a sequence, where the antisense polymucleic acid suppresses the expression of a human, mouse or zebrafish TDEI, PTV or HKE4; and (3) a teleost comprising the antisense polymucleic acid suppresses the expression of a human, mouse or zebrafish TDEI, PTV or HKE4; and (3) a teleost comprising the antisense polymucleic and antisense polymucleic acid suppresses the expression of a nutisense gene therapy. The nucleic acid (1) and polypeptide encoded by it, can be used for anticible contain or treating diseases or disorders associated with aberrant consecution. The diseases may include rheumatoid arthritis, catheroscierosis, diabetes, retunopathies, psoriasis or cancer. The comparison of the present invention. Sequence 577 AA;

Sequence 4, Application US/09177431

Patent No. 6071700:
GENERAL INFORMATION:
APPLICANT: He, Feng
APPLICANT: He, Feng
APPLICANT: Hachson, Allan S.
TITLE OF INVENTION: HETEROLOGOUS POLYPEPTIDE PRODUCTION IN THE
TITLE OF INVENTION: ABSENCE OF NONSENSE-MEDIATED MRNA DECAY FUNCTION
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSEE: Fish & Richardson P.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16699-16903(2002).
-!- FUNCTION: Probably involved in connections of major cytoskeletal structures to the plasma membrane.
-!- SUBCELIULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Component of the microvilli of intestinal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDIJINE=94092743; PubMed=8268231; Lankes W.T., Schwartz-Albiez R., Furthmayr H.; Lonkon and sequencing of porcine moesin and radixin cDNA and identification of highly conserved domains."; Biochim. Biophys. Acta 1216:479-482(1993).

-: FURCHION: Probably involved in connections of major cytoskeletal structures to the plasma membrane.

-: SIMILARITY: Contains 1 FERM domain.
                                                                                                   Gaps

Submitted (DEC-1992) to the EMBL/GenBank/DDBJ databases.

FUNCTION: Intermediate filament-associated protein that associates in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair follicle and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the epidermis.
-i- DOWAIN: Consists of nine domains. Domain 1 contains two EF-hand calcium-binding domains. Domains 2-4, 6, and 8 are almost entirely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SUBDIT: Homodimer (Probable).
-!- TISSUE SPECIFICITY: Found in the hard keratinizing tissues such as the inner root sheath (IRS) of hair follicles and medulla, and in the filiform papillae of dorsal tongue epithelium (Probable).
-!- DEVELOPMENTAL STAGE: Expressed during late differentiation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

alpha-helical, configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is forme most regular and may bind KIF directly by ionic interactions. Domains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among

               Journal of the call envelope to the call envelope or even and and call envelope or even and an another arguments. The call biol intermediate filament associates in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair follicle and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipoptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during terminal
                                                                                                                                                                                                                                                                                                                                                                           Isold=P22793-2; Sequence=VSP 000847, VSP 000848;
ISOUE SPECIFICITY: Found in the hard keratinizing tissues such as the inner root sheath (IRS) of hair follicles and medulla, and in the prithelia of the tongue, hoof and tunen.

DOWAIN: Consists of nine domains. Domain I contains two EF-hand calcium-binding domains. Domains 2-4, 6, and 8 are almost entirely alpha-helical, configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domain 6 is Domains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among
differentiation marker in the hair follicle, contains a 23 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    probably converted to cirullines by peptidylarginine deimidase. SIMILARITY: In the N-terminal section; belongs to the S-100

FUNCTION: Intermediate filament associated protein that associates in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair follicle and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during terminal
                                                                                                                                                                                                                                                                                                                                                                                                                           differentiation.
-!- SUBUNIT: Monomer (Probable).
-!- TISSUE SPECIFICITY: Found in the hard keratinizing tissues such as the inner root sheath (IRS) of hair follicles and medulla, and in the filiform papillae of dorsal tongue epithelium (Probable).
-!- DEVELOPMENTAL STAGE: Expressed during late differentiation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the epidermis.

--- Consists of nine domains. Domain 1 contains two EF-hand calcium-binding domains. Domains 2-4, 6, and 8 are almost calcium-binding domains. Domains 2-4, 6, and 8 are almost entirely alpha-helical. configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical roof stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -!- PTM: Substrate of transglutaminase. Some 200 arginines are probably converted to citrullines by peptidylarginine deimidase.-!- SIMILARITY: In the N-terminal section; belongs to the S-100
